

Inhalation Anaesthetic Agents

by the end of this lecture you should be able to

- plan an appropriate inhalation anaesthetic protocol for any animal

What would you do?

- 14 year old dog
- fibrosarcoma on jaw
- recurred after surgery
- in for radiotherapy

inhalation anaesthesia

- control of
 - airway
 - ventilation
 - drugs going in and out
- expensive machinery
- equipment failure

administration

- effects are dose dependant
- understand how equipment works!
 - 90% of anaesthetic equipment in practice in NZ has faults!!!

uptake & elimination

- physical factors
 - saturated vapour pressure
 - rubber solubility
 - blood gas coefficient
 - blood brain coefficient

uptake & elimination

- physical factors
 - saturated vapour pressure
 - rubber solubility
 - blood gas coefficient
 - blood brain coefficient

uptake & elimination

- other factors
 - ventilation
 - cardiac output
 - lung disease
 - second gas effect

distribution

- all are fat soluble
 - penetrate most tissues
 - fat reservoirs
 - cross placenta

MAC

- minimum alveolar concentration
 - the concentration in the alveolus at a steady state which will prevent purposeful movement in response to a supramaximal stimulus in 50% of animals

drugs

- gases
- halogenated hydrocarbons
- ethers

gases

- nitrous oxide
- xenon
- cyclopropane

oxides of nitrogen

- NO
 - nitric oxide - vasodilator
- N₂O
 - nitrous oxide - anaesthetic
- NO₂
 - nitrogen dioxide - environmental pollutant

nitrous oxide

- MAC = 110 - 250%
- BG = 0.47
- induction & maint - 66%

nitrous oxide

- pro
 - good analgesic
 - fast induction
- con
 - diffusion into gas filled spaces
 - Fink effect
 - circle systems
 - folate metabolism

gases

- nitrous oxide
- xenon
 - good anaesthetic but too expensive to use
- cyclopropane
 - explosive
 - avoid!!!

hydrocarbons

- halothane
- chloroform
- trichloroethylene

halothane

- MAC = 0.9
- BG = 2.4
- svp = 33 kPa
- induction - 2 - 5%
- maintenance - 0.5 - 2%

halothane side effects

- respiratory depression
- reduced cardiac output
- vasodilatation
- sensitises heart to adrenaline
- (halothane hepatitis)
- (malignant hyperthermia)

halothane hepatitis

- about 1:10,000 people
- more likely if previously exposed
- not confined to halothane

malignant hyperthermia

- mainly pigs
- rarely horses
- recorded in dogs

MH treatment

- turn off halothane
- provide 100% oxygen
- cool down
- give dantrolene

hydrocarbons

- halothane
- chloroform
- trichloroethylene

ethers

- diethylether
- isoflurane
- enflurane
- methoxyflurane
- sevoflurane
- desflurane

isoflurane

- MAC = 1.9%
- BG = 1.4
- svp = 32 kPa
- induction - 2 - 3%
- maintenance - 0.5 - 2.5%

sevoflurane

- MAC = 2.5%
- BG = 0.6
- svp = 21 kPa
- induction - 5 - 7%
- maintenance - 0.5 - 3%

ether

- mac = 3%
- BG = 12
- svp = 59 kPa
- induction - as much as possible
- maintenance - 3 - 10%
- inflammable in air, explosive in oxygen

ethers

- diethylether
- isoflurane
- enflurane
- methoxyflurane
- sevoflurane
- desflurane

monitoring

- end tidal vapour concentration
- cardiovascular depression
 - blood pressure
- respiratory depression
 - ET CO₂

interactions

- soda lime
 - trichloroethylene - phosgene
 - isoflurane
 - sevoflurane

inhalation induction

- relatively slow
 - but depends on drug
- long excitement phase
- lots of gas used
- potential for leaks

inhalation induction

- nasty animals
- animals with no veins
- neonatal animals
- (caesarian sections)

scavenging

- use proper scavenging system
- or ensure adequate ventilation

scavenging

- vaporiser filling
 - use a well ventilated place
 - do not spill any!
 - fill at end of day
- check machine for leaks
- use low fresh gas flows

What would you do?

- 14 year old dog
- fibrosarcoma on jaw
- recurred after surgery
- in for radiotherapy

inhalation anaesthetics

- used to maintain anaesthesia after induction with injectable drug
- relatively insoluble drugs produce a relatively fast induction and recovery
- halothane & isoflurane produce dose dependent respiratory and cardiovascular depression but not much analgesia
- drugs are eliminated by respiration - in overdose, ventilate with 100% oxygen
